DEBUGGING ASSESSMENT (PHP + LARAVEL)

Before anything else, please make sure that you have MySQL running in your machine and create a database named students

---

You can start the program by running it with the command:

php artisan serve

It should display an output confirming that the server is running. After that, navigate to the **api** folder where you'll find the **/test-log** endpoint. Execute this endpoint to generate your logger file.

Task #1

Stop the server or spin up a new instance, then run the command:
`php artisan migrate:fresh`

This will recreate the required tables in your database. However, during the process, you'll run into an error. (Please check your logger file for more information)

Task #2

After solving task 1, execute again the migrate command and you should encounter a new problem. (Please check your logger file for more information)

```
laravel.log
[previous exception] [object] (PDOException(code: 1049): SQLSTATE[HY000] [1049] Unknown database 'laravel'
```

Once Task #2 has been resolved, you'll be able to view the migration results.

```
laravel.log
  INFO  Preparing database.

  Creating migration table ..................................................... 52.99ms DONE

   INFO  Running migrations.

  0001_01_01_000000_create_users_table ......................................... 258.34ms DONE
  0001_01_01_000001_create_cache_table ......................................... 50.64ms DONE
  0001_01_01_000002_create_jobs_table .......................................... 168.85ms DONE
  2025_09_13_030847_create_students_table ...................................... 26.11ms DONE
```

You can confirm the existence of the table inside your database.

Task #3

Be sure to restart the server if stopped, then run the endpoint for creating new student records using the data below, making sure it's under **form-data** since Laravel processes inputs in this format for standard form submissions.

You should be expecting this error in response since there's an issue in your connection.

```
{"error":"Server error","message":"Unable to add student. Check Laravel logs for more info."}
```

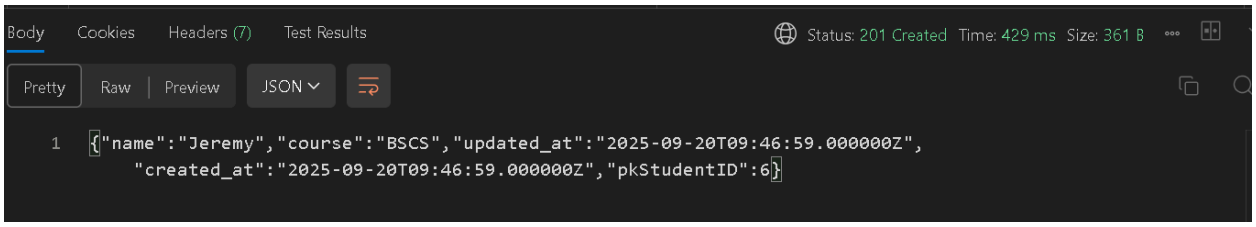

Inside your logs, this should be the error message you'll encounter. Make sure to fix this one first.

Once you resolve that, another error should appear similar to the one you just fixed.

Once solved, it should return the student information with 201 status created. (Create 3 different students)

Task #4

In Task #4, run the endpoint to fetch all student records, and at this point, you should come across this error.

Once you've resolved this, you should get the expected output (note that the response may differ depending on the data in your student table).

laravel.log

[{"pkStudentID":1,"name":"Jeremy","course":"BSC","created_at":"2025-09-20T10:38:16.000000Z","updated_at":"2025-09-20T10:38:16.000000Z"}]

Task #5

For the last task, delete the user Id 1, however you'll encounter another error once again

laravel.log

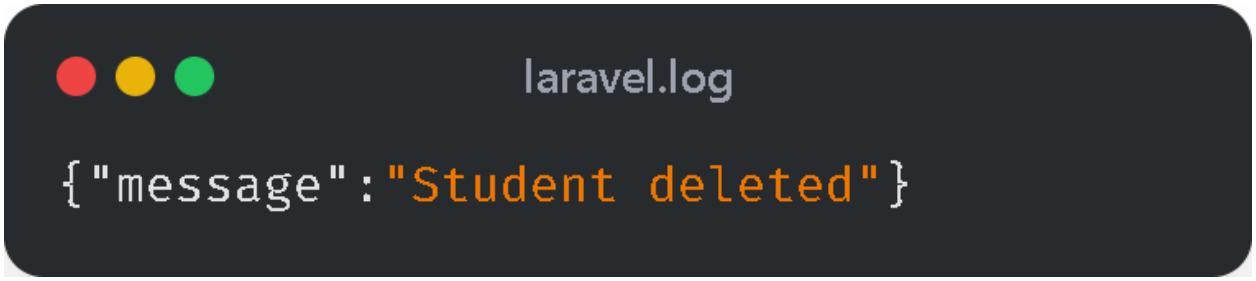

[2025-09-20 10:47:39] local.ERROR: Call to undefined method App\Http\Controllers\StudentController::deleteStudent() {"exception":"[object] (Error(code: 0): Call to undefined method App\\Http\\Controllers\\StudentController::deleteStudent() at C:\\Users\\jerem\\Desktop\\php-laravel debugging\\php-laravel-api\\php-laravel-api-main\\student-api\\vendor\\laravel\\framework\\src\\Illuminate\\Routing\\ControllerDispatcher.php:46)
[stacktrace]

Once, solved. It should show another error.

laravel.log

[2025-09-20 10:49:52] local.ERROR: Undefined constant "App\Http\Controllers\this" {"exception":"[object] (Error(code: 0): Undefined constant \"App\\Http\\Controllers\\this\" at C:\\Users\\jerem\\Desktop\\php-laravel debugging\\php-laravel-api\\php-laravel-api-main\\student-api\\app\\Http\\Controllers\\StudentController.php:95)
[stacktrace]

Once fixed, this is the final output

This ends your debugging assessment.
